

Technical Content Becomes User Friendly

Wild-Webs, Inc. worked with Amgen to create online courseware for EPOGEN®, a medication for the treatment of acute anemia. Using the EPOGEN® package insert, Wild-Webs created an online course, reinforcement interactions (quizzes, tests, graphics and multimedia), and associated programming to educate health professionals about the product.

EPOGEN® was developed by scientists at Amgen, and is an exact copy of the natural hormone that is made by healthy kidneys. It works just like this hormone and instructs bone marrow to make red blood cells.

Wild-Webs was able to convert this technical publication with critical health, dosing and prescribing information into an easy to use e-learning experience for healthcare professionals.

Wild-Webs develops custom, interactive and database driven online solutions for business. We create solutions to meet a variety of needs, such as: promoting your business to the general public; intranet applications for use within your company; and private sites (extranet) for sharing content with clients and partners.
